RECORD. ALL CITATIONS AVAILABLE IN THE RE FORMAT

AB Layered Li[Li(1-2x)/3Ni<sub>x</sub>Mn(2-x)/3]O<sub>2</sub> (x = 0.35, 0.305, and 0.23) powders  
with high homogeneity and crystallinity have been synthesized using a  
sol-gel method. The layered structure solid solns. were obtained by Ni  
substitution for Li and Mn in Li<sub>2</sub>MnO<sub>3</sub>. The discharge capacity of the  
Li[Li(1-2x)/3Ni<sub>x</sub>Mn(2-x)/3]O<sub>2</sub> **electrode** increased with a decrease  
in Ni concn. The Li[Li<sub>0.18</sub>Ni<sub>0.23</sub>Mn<sub>0.59</sub>]O<sub>2</sub> **electrode** delivers a  
very high capacity of 200 mA h g<sup>-1</sup> with excellent cyclability. Although  
the unusual capacity behavior is not yet revealed, the oxygen valence may  
also play an important role for charge compensation in  
Li[Li(1-2x)/3Ni<sub>x</sub>Mn(2-x)/3]O<sub>2</sub> materials.

IT 505069-59-0P, Lithium manganese nickel oxide (Li<sub>0.1</sub>Mn<sub>0.55</sub>Ni<sub>0.35</sub>O<sub>2</sub>)

REFERENCE COUNT: 25 THERE ARE 25 CITED REFERENCES AVAILABLE FOR THIS  
RECORD. ALL CITATIONS AVAILABLE IN THE RE FORMAT

AB  $\text{Li}_{0.7}[\text{Ni}_{1/6}\text{Mn}_{5/6}]\text{O}_2$  powders were prepd. by ion exchange of Li for Na in  
 $\text{Na}_{2/3}[\text{Li}_{1/6}\text{Mn}_{5/6}]\text{O}_2$  precursor, synthesized by a sol-gel method using  
glycolic acid as a chelating agent. The material delivers 180 mA-h/g and  
has excellent cyclability, retaining 98% (0.0486 mA-h/g.cntdot.cycle) of  
the initial capacity after 50 cycles. The electrochem. behavior and  
structural transformation of a  $\text{Li}_{0.7}[\text{Ni}_{1/6}\text{Mn}_{5/6}]\text{O}_2$  electrode  
after cycling was studied using x-ray diffraction, TEM, and cyclic  
voltammetry (CV). Both charge/discharge and CV curves indicate that the  
 $\text{Li}_{0.7}[\text{Ni}_{1/6}\text{Mn}_{5/6}]\text{O}_2$  powder has unique electrochem. properties that differ  
from those of the layered or spinel Li-Mn-O phases. Examn. of the powder  
structure using TEM revealed that the as-prepd. powder consists of a new  
type of defective spinel structure with a high d. of planar faults along a  
particular crystallog. direction, which appears to be removed by  
electrochem. cycling.

IT 462114-56-3, Lithium manganese nickel oxide ( $\text{Li}_{0.7}\text{Mn}_{0.83}\text{Ni}_{0.17}\text{O}_2$ )

AB A solid electrolyte cell in which cell characteristics are not deteriorated even on overdischarge to the cell voltage of 0 V, such that the shape of the cell encapsulated in the laminate film is maintained. The cell includes a cathode contg. a compd. represented by the general formula  $\text{Li}x\text{Fe}1-y\text{MyPO}_4$  where  $0.05 \leq x \leq 1.2$ ,  $0 \leq y \leq 0.8$ , and M is at least one selected from the group consisting of Mn, Cr, Co, Cu, Ni, V, Mo, Ti, Zn, Al, Ga, Mg, B and Nb, an anode and a solid electrolyte. An electrode unit comprised of the cathode and the anode layered together with interposition of the solid electrolyte is encapsulated with a laminate film 2.

AB A pos. **electrode** active material is a layered lithium manganese compd. represented by a general formula  $\text{Li}_{1-x}\text{MO}_2$ , where x is a lithium-deficient quantity and larger than 1/5, and M is manganese or metals of two or more kinds contg. manganese as a main component. The metals are preferably 3d-transition metals. The pos. **electrode** active material has a high capacity and is excellent in structure stability. A rechargeable lithium-ion battery uses a pos. **electrode** material contg. the pos. **electrode** active material and is excellent in cyclic stability.

AB A rechargeable lithium battery includes a neg. **electrode** material having a total irreversible capacity of 45% or less of a total capacity of a pos. **electrode** material. By adjusting the irreversible capacity of the neg. **electrode** material in a wide range, a cryst. structure of the pos. **electrode** material during charge-discharge is stably maintained, and cyclic resistance of the rechargeable lithium battery is improved. Moreover, the rechargeable lithium battery having a large capacity and high cyclic resistance at high temp. can be provided by the use of Li deficient type lithium manganese oxide of a layer structure as a pos. **electrode** material.

AB A pos. **electrode** active material for a nonaq. electrolyte  
 secondary battery includes at least a lithium-contg. manganese layered  
 composite oxide represented by the general formula  $\text{Li}_{1-x}\text{Mn}_1\text{yMyO}_2$ .psi..  
 The lithium-contg. manganese composite oxide is deficient in lithium with  
 respect to the stoichiometric compn. of a layered crystal structure  
 represented by the general formula  $\text{LiMeO}_2$ . Part of Mn is replaced by a  
 substitute metal such as Co, Ni, Fe, Al, Ga, In, V, Nb, Ta, Ti, Zr, Ce or  
 Cr.

AB Synthesis of the layered lithium intercalation compd.  $\text{Li}_x\text{Mn}_1-y\text{Ni}_y\text{O}_2$ ,  
with the O3 (.alpha.- $\text{NaFeO}_2$ ) structure is reported and it is shown to  
exhibit amongst the highest capacity to cycle lithium (charge) on  
intercalation/deintercalation (220 mA h g<sup>-1</sup> between potential limits of  
2.4 to 4.8 V) of any such material and at a relatively high  
charge/discharge rate; the ion exchange conditions used in the synthesis  
have an important influence on the defect chem. of the host structure and  
this in turn influences the performance of the compd. as an  
**electrode** in rechargeable lithium batteries.

TI	Manufacture of positive <b>electrode</b> for use in lithium secondary battery				
AB	The pos. <b>electrode</b> has a general formula $\text{Li} \cdot \alpha \cdot \text{Mn}_{1-x-y} \text{A}_x \text{B}_y \text{O}_z$ where 1st metal A is selected from Mg, Al, Fe, Co, Ni, and Cu, 2nd metal B is selected from Ti, Zr, V, Nb, Ta, Mo, Re, W, and Ru, $0.5 \cdot \text{ltoreq} \cdot \alpha \cdot \text{ltoreq} \cdot 1$ , $0.01 \cdot \text{ltoreq} \cdot x$ , $0.01 \cdot \text{ltoreq} \cdot y$ , and $0.02 \cdot \text{ltoreq} \cdot x+y \cdot \text{ltoreq} \cdot 0.5$ . The <b>electrode</b> active material is manufd. by mixing lithium source, manganese source, 1st metal, and 2nd metal at a ratio of $0.5:(1-x-y):x:y$ in the presence of a complexing agent to form a complex soln., spray-drying the soln. to drive-off the solvent to obtain a precursor, and heat-treating the precursor. The material is used in the lithium secondary battery.

AB Lithium nickelate is an attractive pos. **electrode** material for  
lithium ion batteries because of its large capacity at ambient temps.  
However, highly delithiated  $\text{LiNiO}_2$  (e.g.,  $\text{Li}_{0.2}\text{NiO}_2$ ) shows undesirable  
exothermal heat at 200.degree.. We found another issue of  $\text{LiNiO}_2$  in this  
study, namely poor reversibility at 40.degree.. To overcome these  
disadvantages, we introduced cobalt, manganese, and titanium as partial  
substituents for nickel. Cobalt substitution was effective in improving  
the reversibility at 40.degree.. The exothermal decompn. of the  
delithiated compds. was suppressed by using manganese and titanium as  
substituents. We found doubly substituted nickelate  $\text{LiNi}_{0.8}\text{Co}_{0.1}\text{Ti}_{0.1}\text{O}_2$   
to be the most promising in terms of large capacity (190 mA h g<sup>-1</sup>),  
enhanced high-temp. performance, and improved thermal stability.

IT 259190-87-9P, Lithium manganese nickel oxide  
( $\text{Li}_{0.67}\text{Mn}_{0.67}\text{Ni}_{0.33}\text{O}_2$ )

RL: DEV (Device component use); PRP (Properties); SPN (Synthetic  
preparation); PREP (Preparation); USES (Uses)  
(O2 structure lithium nickel manganese oxide layered cathode material  
for rechargeable lithium batteries)

L10 ANSWER 19 OF 28 CAPLUS COPYRIGHT 2003 ACS

ACCESSION NUMBER: 1999:331189 CAPLUS

DOCUMENT NUMBER: 131:7572

TITLE: Manufacture of nickel mixed oxide and batteries with  
cathodes using it

INVENTOR(S): Arai, So; Sakurai, Yoji; Masayo, Takahisa; Yamaura,  
Junichi; Kondo, Shigeo; Tsutsumi, Shuji; Hasegawa,

PATENT ASSIGNEE(S): Masaki  
Nippon Telegraph and Telephone Corp., Japan;
